

## C. League of Leesins

time limit per test: 2 seconds  
 memory limit per test: 256 megabytes  
 input: standard input  
 output: standard output

Bob is an avid fan of the video game "League of Leesins", and today he celebrates as the League of Leesins World Championship comes to an end!

The tournament consisted of  $n$  ( $n \geq 5$ ) teams around the world. Before the tournament starts, Bob has made a prediction of the rankings of each team, from 1-st to  $n$ -th. After the final, he compared the prediction with the actual result and found out that the  $i$ -th team according to his prediction ended up at the  $p_i$ -th position ( $1 \leq p_i \leq n$ , all  $p_i$  are unique). In other words,  $p$  is a permutation of  $1, 2, \dots, n$ .

As Bob's favorite League player is the famous "3ga", he decided to write down every 3 consecutive elements of the permutation  $p$ . Formally, Bob created an array  $q$  of  $n - 2$  triples, where  $q_i = (p_i, p_{i+1}, p_{i+2})$  for each  $1 \leq i \leq n - 2$ . Bob was very proud of his array, so he showed it to his friend Alice.

After learning of Bob's array, Alice declared that she could retrieve the permutation  $p$  even if Bob rearranges the elements of  $q$  and the elements within each triple. Of course, Bob did not believe in such magic, so he did just the same as above to see Alice's respond.

For example, if  $n = 5$  and  $p = [1, 4, 2, 3, 5]$ , then the original array  $q$  will be  $[(1, 4, 2), (4, 2, 3), (2, 3, 5)]$ . Bob can then rearrange the numbers within each triple and the positions of the triples to get  $[(4, 3, 2), (2, 3, 5), (4, 1, 2)]$ . Note that  $[(1, 4, 2), (4, 2, 2), (3, 3, 5)]$  is not a valid rearrangement of  $q$ , as Bob is not allowed to swap numbers belong to different triples.

As Alice's friend, you know for sure that Alice was just trying to show off, so you decided to save her some face by giving her **any permutation**  $p$  that is consistent with the array  $q$  she was given.

### Input

The first line contains a single integer  $n$  ( $5 \leq n \leq 10^5$ ) — the size of permutation  $p$ .

The  $i$ -th of the next  $n - 2$  lines contains 3 integers  $q_{i,1}, q_{i,2}, q_{i,3}$  ( $1 \leq q_{i,j} \leq n$ ) — the elements of the  $i$ -th triple of the **rearranged** (shuffled) array  $q_i$ , in random order. Remember, that the numbers within each triple can be rearranged and also the positions of the triples can be rearranged.

It is guaranteed that there is at least one permutation  $p$  that is consistent with the input.

### Output

Print  $n$  distinct integers  $p_1, p_2, \dots, p_n$  ( $1 \leq p_i \leq n$ ) such that  $p$  is consistent with array  $q$ .

If there are multiple answers, print any.

### Example

input	Copy
5 4 3 2 2 3 5 4 1 2	
output	Copy
1 4 2 3 5	

### Codeforces Round #601 (Div. 2)

Finished

Practice

### → Virtual participation

Virtual contest is a way to take part in past contest, as close as possible to participation on time. It is supported only ICPC mode for virtual contests. If you've seen these problems, a virtual contest is not for you - solve these problems in the archive. If you just want to solve some problem from a contest, a virtual contest is not for you - solve this problem in the archive. Never use someone else's code, read the tutorials or communicate with other person during a virtual contest.

Start virtual contest

### → Practice

You are registered for practice. You can solve problems unofficially. Results can be found in the contest status and in the bottom of standings.

### → Clone Contest to Mashup

You can clone this contest to a mashup.
